Abstract
Strategic Anticipation – Harnessing People Power

The goal is to enhance the analyst's ability to see and discover patterns from data, although technology is an important enabler, it is people that must be enabled to extend human decision making. One aspect in enabling diverse people from both within organizations and across organizations is the application of collaboration and, specifically, the concept of collaborative analytics. This is a global network need.

This presentation provides thought around how people can work together and share valuable information, and a pilot on such a vision. It is about people coming together in a global network of knowledge and how this can be achieved to underpin strategic anticipation. It is much more than technology, and something that may just be an enabler to harness the power of people.
